<u>Abstract</u> - A new type of acridone dimer with a C-C junction between the prenyl moieties was obtained by treating norisoacronycine under acidic conditions. The chemical structure was deduced mainly by the comparison of its nmr spectral data with those of the acridone dimers which had been prepared previously.

A new type of acridone dimer (1) with a C-C junction between the prenyl moieties was synthesized by treating norisoacronycine (2) under acidic conditions. Its chemical structure was deduced mainly by comparison of its nmr spectra with those of AB-1 (3) and AB-2 (4) which had been prepared by treating noracronycine (5) in acidic conditions.²

Norisoacronycine $(2)^2$ (32.5 mg) was dissolved in a mixture of 12N HCl-CH₃OH (1:2.5) and this yellow solution was refluxed for 8 hours. The orange reaction mixture was extracted with CHCl₃ (3 x 60 ml) and purified by p-tlc (benzene-EtOAc 9:1 (v/v), Rf = 0.50) to afford a

norisoacronycine-norisoacronycine dimer $(1)^3$ (5.0 mg; yield 15 %), as well as unreacted norisoacronycine (2) (2.1 mg). If the same type of reaction observed previously² would have occurred the chemical structure of the dimeric compound obtained should have the structure (6).

Prior to elucidating the structure of the norisoacronycine-norisoacronycine dimer as $1, {}^{13}C$ nmr spectral assignments of AB-1 (3) and AB-2 (4) were accomplished by a combination of ${}^{1}H_{-}{}^{1}H$ COSY, ${}^{13}C_{-}{}^{1}H$ COSY and long range ${}^{13}C_{-}{}^{1}H$ COSY nmr experiments (Table 1).

Table 1. ¹³C Nmr spectra of 1, AB-1 (3) and AB-2 (4).

5

The chemical structure of 1 was deduced mainly by comparison of its nmr spectral data with those of 3 and 4. The lower field shifts (ca. 10 ppm) of the N-CH₃ moieties of 3 (δ_C 43.4 and 43.5) compared with that of the linear type moiety of 4 (N₁₀"-CH₃, δ_C 33.9), indicated that since the two N₁₀-CH₃ and N₁₀"-CH₃ signals of 1 were observed at regular field (δ_C 32.8 and 33.0), no bulky substituent was attached peri- to either N-CH₃ group. Therefore, the possibility of structure (6) or any linear-angular structure dimer obtained through this reaction was denied.

In the ¹H nmr spectrum of 1, a set of three signals were observed at δ_H 3.66 (1H, dd, J = 7, 10 Hz, H-1'), 1.95 (1H, dd, J = 10, 14 Hz, H-2') and 2.22 (1H, dd, J = 7, 14 Hz, H-2'). Such signals had been also observed in the ¹H nmr spectra of 3 and 4, albeit the chemical shift of the methine of 1 appeared higher than those of 3 (δ_H 5.165 (1H, dd, J = 7.3, 11.7 Hz)) and 4 (δ_H 4.904 (1H, dd, J = 7.7, 11.5 Hz)).² On the other hand, a set of doublets observed in the ¹H nmr of 3 ($\delta_{\rm H}$ 5.116 and 6.171 (J = 9.6 Hz)) and 4 ($\delta_{\rm H}$ 5.309 and 6.463 (J = 9.6 Hz))² disappeared in the ¹H nmr of 1; instead a singlet at δ_H 6.30 (δ_C 110.2) was apparent. Two more singlet resonances (δ_H 6.28, 6.29) were observed in the ¹H nmr of 1, and these signals were correlated to δ_{C} 90.1 and 90.9, respectively, and were similar to that of the C-4 chemical shift (δ_C 91.5) observed in the ¹³C nmr spectrum of **4**. Correlations between δ_C 103.5 (2 x C) and δ_H 14.85 and 15.03 (each 1H. s) enabled the assignments of these ^{13}C signals as C-9a and C-9"a to be made. In addition, in the long range ${}^{13}C-{}^{1}H$ COSY spectrum, δ_H 6.28 and 6.29 were found to be correlated to C-9a and C-9a'. These results indicated that 1 possessed two C4-H moieties. Because a singlet resonance at δC 141.0 was correlated to δH 3.66 (C-1) and was also correlated to the C-4" and C-5^{III} signals (δ_H 1.59 and 1.77), the second unit was found to be attached to the C-2^{III} position. Thus, it was concluded that the C1' position of the first unit and the C2" position of the second unit were joined. The reaction mechanism for the formation of 1 was considered to be shown in Figure 1.

Figure 1. Dimerization of Norisoacronycine (2) in Acidic Conditions.

As acridone dimers, Diels-Alder adducts⁴ have been reported to possess a C-C bond between the prenyl moieties of two acridone moieties, but the linkage points of compound (1) are different from those compounds reported previously.

As expected, compound (7) was obtained when the above reaction was performed using 12N DCl and CH₃OD.⁵ In the ¹H nmr of 7, the methylene resonance of 1 at H₂-2' disappeared and a methine resonance at $\delta_{\rm H}$ 3.66 (dd, H-1') was changed into a singlet at $\delta_{\rm H}$ 3.72 (s, H-1').² In addition, two of the three singlet methine resonances disappeared² and only a singlet at $\delta_{\rm H}$ 6.36 (s, H-1''') was observed.
