#### Abstract

An efficient microwave-assisted one-pot and three-component synthesis of substituted 1,2,4-triazoles has been achieved utilizing substituted primary amines.

## INTRODUCTION

1,2,4-Triazoles are attractive constructs because of their unique chemical properties and structure. They have been found many applications in organic, organometallic, and medicinal chemistry, as well as in materials chemistry and biology. ${ }^{1}$ As a consequence, a number of synthetic methods have been developed to construct this ring system. ${ }^{1,2}$ The three-component procedure developed by Stocks ${ }^{3}$ was the first one-pot synthesis reported for preparation of 1,2,4-triazoles, though it provided an efficient procedure and the possible reaction pathway to prepare 1,2,4-triazoles. There remains a drawback of low yield in the synthesis of 4-alkyl-substituted 1,2,4-triazoles. As well-known, microwave induced has emerged as a powerful technique to promote a variety of organic reactions under solvent-free conditions offering reduced pollution and low cost together with simplicity in processing and handling. ${ }^{4}$ These promote us to carry out this one-pot, three-component reaction with microwave assisted.

## RESULTS AND DISCUSSION

In our initial studies, $N^{\prime}$-acetyl- $N, N$-dimethylhydrazonoformamide (1) was generated by combining acetic hydrazide with DMF-DMA(dimethylformamide dimethylacetal) in $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ under refluxing(Scheme 1); then acidic $\mathrm{Al}_{2} \mathrm{O}_{3}$ was used as a carrier and was catalyst in the acid-catalyzed ring closure step. ${ }^{5}$ However, no desired product was obtained under microwave irradiation.

Scheme 1 Initial Results Employing Butylamine with MW

Since the desired products were not obtained under solvent-free condition, acetic acid was used as solvent also as catalyst instead of acidic $\mathrm{Al}_{2} \mathrm{O}_{3}$. The mixture reacted under microwave irradiation for 2-3 min to prepare the substituted 1,2,4-triazoles. Fortunately, satisfactory results were obtained (Table 1).

Note: ${ }^{a}$ This yield was provided by reference $3 .{ }^{\mathrm{b}}$ This yield was achieved by using $N$-dimethoxymethyl- $N, N^{\prime}, N^{\prime}$ 'trimethylethane-1,2-diamine instead of DMF-DMA.

Our microwave-assisted procedure is more efficient than that without microwave-assisted with higher yield and shorter reaction time.

## EXPERIMENTAL

Melting points were determined with an XT-4 apparatus and were uncorrected. The ${ }^{1}$ HNMR spectra were measured with BRUKER AV-300 spectrometers.

## General Prcedure for the synthesis of substituted 1,2,4-triazoles:

In an open vessel ( 25 mL ), acetic hydrazide ( $222 \mathrm{mg}, 3 \mathrm{mmol}$ ) was dissolved in dichloromethane ( 2 mL ) and dimethylformamide dimethyl acetal ( 3 mmol ) was added. The reaction mixture was refluxing for 30 min , evaporated in vacuo and $\mathrm{RNH}_{2}(2.8 \mathrm{mmol})$ was added followed by acetic acid ( 1.5 mL ). The reaction mixture was standed under microwave irradiation for 2-3 min, then cooled, concentrated and the residue was purified by chromatography on silica gel.(Eluent: MeOH : Ethyl Acetate $=20: 1$ to MeOH : Ethyl Acetate=1:1).
