# REACTION OF 4-AMINO-1,2,4-TRIAZOLIUM SALTS WITH POLARIZED OLEFINS 

Yoshiro Matsuda,* Yasusige Chiyomaru, Kazuki Furuno, and Takanobu Nishiyori School of Pharmaceutical Sciences, Nagasaki University, 1-14 Bunkyo-machi Nagasaki 852, Japan

#### Abstract

The reaction of 4-amino-1,2,4-triazolium salts (5a,b) with polarized olefins ( $\mathbf{3 a}, \mathbf{b}, 4 \mathrm{a}$ ) in the presence of $\mathrm{K}_{2} \mathrm{CO}_{3}$ in EtOH or DMSO directly yielded the back-donated 1,6-cyclization products, mesomeric betaines ( $6 \mathbf{a}-\mathbf{c}, 7 \mathbf{a}, \mathbf{b}$ ) via N vinylimino ylides, while the reaction of the salts (5a,b) with polarized olefins (4b,c) gave the 1,5 -dipolar cyclization products, pyrazoles ( $\mathbf{1 0} \mathbf{a}, \mathbf{b}$ ) and $[1,2,4]-$ triazolo[4,3-b]pyrazole (11).

It is well known that heterocyclic salts react with polarized olefins to produce heterocyclic $N$-allylides (1) and these $N$-allylides (1), acting as extended dipole are of interest in heterocyclic chemistry. ${ }^{1}$ Recently we reported a synthesis of mesomeric betaine (2) due to the resonance structure ( $\mathbf{1}^{\prime}$ ) and we proposed a mechanism which involves a back-donated 1,6-cyclization for this transformation ${ }^{2}$ (Scheme 1).

Scheme 1

The purpose of the present investigation is to extend this back-donated 1,6-cyclization to the synthesis of $[1,2,4]$ triazolo $[4,3-b]$ pyridaziniumides $(6,7)$ which were prepared by the reaction of 4 -amino-1,2,4-
triazolium salt (5) with polarized olefins (3a,b,4a). The olefins (3,4) used in the present work are shown in Scheme 2. The starting materials, 4-amino-1,2,4-triazolium salts (5a,b) were prepared by Becker's method. ${ }^{1 b}$

Scheme 2

Treatment of the salts ( $\mathbf{5 a}, \mathbf{b}$ ) and polarized olefins ( $\mathbf{3 a}, \mathbf{b}$ ) with $\mathrm{K}_{2} \mathrm{CO}_{3}$ in EtOH at room temperature for a week did not give $N$-vinylimino ylides, but directly afforded the betaines, [1,2,4]triazolo[4,3-b]pyridaziniumides (6a-c). In addition, the salt (5b) and the olefin (4a) were treated with $\mathrm{K}_{2} \mathrm{CO}_{3}$ in EtOH to give the mesomeric betaine ( $\mathbf{7 b}$ ). On the other hand, the reaction of $\mathbf{5 a}$ with $\mathbf{4 a}$ in EtOH did not proceed. In our previous paper we reported the synthesis of the mesomeric betaine, imidazo $[1,2-b]$ pyridaziniumide by the reaction of aminoimidazolium salt with the olefin (4a) in the presence of $\mathrm{K}_{2} \mathrm{CO}_{3}$ in dimethyl sulfoxide (DMSO) at room temperature for a week. ${ }^{2 a, d}$ Therefore we treated $5 \mathrm{a}, \mathrm{b}$ with $\mathbf{4 a}$ in DMSO to give the mesomeric betaines (7a,b) (Scheme 3).

In order to obtain the parent base of the $[1,2,4]$ triazolo[4,3-b]pyridaziniumide derivatives (6,7), we examined various conditions for removal of the ethoxycarbonyl or cyano groups, and succeeded in isolation of $[1,2,4]$ triazolo $[4,3-b]$ pyridaziniumides $(9 \mathbf{a}, \mathbf{b})$. The ethoxycarbonyl group of $\mathbf{6 a , b}$ could be easily removed upon treatment with $47 \%$ hydrobromic acid under reflux to give the hydrobromides (8a,b), which were converted to the free bases (9a,b) by the use of $\mathrm{K}_{2} \mathrm{CO}_{3}$ (Scheme 4).

The mesomeric betaines (6-9) can be described to a first approximation by the resonance structures $A$ and B as shown in Scheme 5. The 7-carbonyl absorption maxima for the mesomeric betaines ( $\mathbf{6 a - c}$ ) in the ir spectrum show at $1610-1640 \mathrm{~cm}^{-1}$, while those for the other mesomeric betaines (7-9) show at 1560-1600 $\mathrm{cm}^{-1}$. This fact indicates that the formers ( $\mathbf{6 a - c}$ ) have the dipole form A due to the resonance structure ( $6 a^{\prime}, b^{\prime}$ and $6 c^{\prime}$ ) and the latters (7-9) have the dipole form B.

The reaction of $5 \mathbf{5 a}, \mathbf{b}$ with 2,2-bis(methylthio)-1-nitroethylene ( $\mathbf{4 b}$ ) in the presence of $\mathrm{K}_{2} \mathrm{CO}_{3}$ in EtOH gave the $\mathbf{1 , 5}$-dipolar cyclization products, pyrazoles $(\mathbf{1 0 a}, \mathrm{b})$. Similar treatment of $\mathbf{5 a}$ with $\mathbf{4 c}$ afforded the [1,2,4]triazolo[4,3-b]pyrazole derivatives (11) (Scheme 6).

Scheme 4

Scheme 5

The formation of $\mathbf{7 b}$ may be rationalized by the outline in Scheme 7. As pointed out in our previous paper, ${ }^{2}$ the mechanism for formation of $\mathbf{7 b}$ may proceed via intermediate, $N$-vinylimino ylide (12). Thus, the intermediate (12) may undergo back-donated 1,6 -cyclization due to the resonance structure (12') to give the mesomeric betaine (7b). On the other hand, as pointed out by Meth-Cohn ${ }^{1 \mathrm{e}}$ and Acheson, ${ }^{1 \mathrm{k}}$ the formation of 10a and 11 may be rationalized as outlined in Scheme 8.

## EXPERIMENTAL

Melting points were determined with a Mitamura Mel-Temp and are uncorrected. Ir spectra were recorded in KBr pellets on a JASCO IRA-2 spectrophotometer. Uv spectra were recorded on a Hitachi 323 spectrophotometer. ${ }^{1} \mathrm{H}-\mathrm{Nmr}$ and ${ }^{13} \mathrm{C}-\mathrm{nmr}$ spectra were obtained on JNM-FX-90Q and JNM-GX400 spectrometer with tetramethylsilane as an internal standard. Chemical shifts are reported in parts per million ( $\delta$ ). Elemental analyses (C,H,N) of all compounds described here were performed on a Yanagimoto MT-2 CHN recorder.

The preparation of the salt (5b)
By Becker's method, ${ }^{1 \mathrm{~b}}$ a mixture of 4 -amino-1,2,4-triazole (Aldrich) ( $16.8 \mathrm{~g}, 0.2 \mathrm{~mol}$ ) and benzyl bromide ( $34.2 \mathrm{~g}, 0.2 \mathrm{~mol}$ ) in acetone ( 200 ml ) was stirred at room temperature for a week and the precipitate was collected by filtration, washed with acetone, dried and recrystallized from EtOH to give $\mathbf{5 b}$.

5b: mp $141-143{ }^{\circ} \mathrm{C}(28.1 \mathrm{~g}, 55 \%)$. $\operatorname{Ir}(\mathrm{KBr}) 3270,3230 \mathrm{~cm}^{-1}$; ${ }^{1} \mathrm{H}-\mathrm{nmr}$ (DMSO- $\left.d_{6}\right) 5.58$ ( $2 \mathrm{H}, \mathrm{s}$, $\left.\mathrm{CH}_{2} \mathrm{Ar}\right), 6.92(1 \mathrm{H}, \mathrm{s}, \mathrm{C} 3-\mathrm{H}), 7.42(5 \mathrm{H}, \mathrm{s}, \mathrm{Ar}-\mathrm{H}), 9.19(1 \mathrm{H}, \mathrm{s}, \mathrm{C} 5-\mathrm{H})$. Anal. Calcd for $\mathrm{C}_{4} \mathrm{H}_{11} \mathrm{~N} 4 \mathrm{Br}: \mathrm{C}$, 42.37; H, 4.35; N, 21.96. Found: C, 42.15; H, 4.49; N, 21.88.

General Procedure for the Preparation of 6, 7, 10, and 11
Method A: A mixture of 4-amino-1,2,4-triazole ( $0.17 \mathrm{~g}, 2 \mathrm{mmol}$ ) and iodomethane ( $0.29 \mathrm{~g}, 2 \mathrm{mmol}$ ) in acetone ( 20 ml ) was stirred at room temperature for a week and the mixture was then evaporated under reduced pressure to give the salt (5a). A mixture of the crude salt (5a), a olefin (3a, 4b,c) ( 2 mmol ) and $\mathrm{K}_{2} \mathrm{CO}_{3}$ ( $0.61 \mathrm{~g}, 4 \mathrm{mmol}$ ) in $\mathrm{EtOH}(40 \mathrm{ml})$ was stirred at room temperature for a week and the mixture was poured into ice-cold water ( 100 ml ). The mixture was extracted with $\mathrm{CHCl}_{3}(4 \times 30 \mathrm{ml})$ and the combined extracts were washed with water, dried ( $\mathrm{Na}_{2} \mathrm{SO}_{4}$ ), and evaporated under reduced pressure. The residue was submitted to column chromatography on silica gel. From a benzene- $\mathrm{CHCl}_{3}$ (10:1) fraction, the product ( $\mathbf{6 a}, \mathbf{1 0 a}, \mathbf{1 1}$ ) was obtained.

Method B: A mixture of the salt ( $5 \mathbf{b}$ ) ( $0.51 \mathrm{~g}, 2 \mathrm{mmol}$ ), a olefin ( $\mathbf{3 a}, \mathbf{b}, 4 \mathrm{a}, \mathbf{c}$ ) ( 2 mmol ), and $\mathrm{K}_{2} \mathrm{CO}_{3}$ ( $0.61 \mathrm{~g}, 4 \mathrm{mmol}$ ) in $\mathrm{EtOH}(40 \mathrm{ml})$ was stirred at room temperature for a week. The resulting mixture was treated as described for method A. From a benzene- $\mathrm{CHCl}_{3}$ (10:1) fraction, the product ( $\mathbf{6 b}, \mathbf{c}, \mathbf{7 b}, 10 \mathrm{~b}$ ) was obtained.

Method C: A mixture of the salt (5a,b) (2 mmol), a olefin (4a) (0.41 g, 2 mmol ), and $\mathrm{K}_{2} \mathrm{CO} 3(0.61 \mathrm{~g}$, $4 \mathrm{mmol})$ in DMSO ( 30 ml ) was stirred at room temperature for a week and the mixture was then poured into ice-cold water ( 100 ml ). The precipitate was filtered, washed with water, dried and recrystallized from $\mathrm{CHCl}_{3}-\mathrm{EtOH}$ to give product $(7 \mathrm{a}, \mathrm{b})$.

6a: $\mathrm{mp} 161-163^{\circ} \mathrm{C}$ (Method A: 50\%).
